

Dis 6A: Probability Distributions

Monday, 27 July 2020 8:45 PM

A **probability distribution** of a random variable X is a _____.

e.g. $\Pr(X = k) = \dots$

Geometric RV

X = "Number of coin flips until you get your first heads (including the first heads)"

Random experiment: a series of **independent** _____ **trials** (only 2 outcomes are success or failure) **until the** _____ **success (inclusive)**, where each trial succeeds with probability p

Example of random experiment for a geometric RV X : _____

$E[X] =$

$\text{Var}[X] =$

$\Pr[X = k] =$

Poisson RV

X = "Number of soldiers in the Prussian army killed accidentally by horse kicks **per hour**"

The parameter for this distribution is the **average** number of occurrences **per unit time**.

$E[X] =$ _____

$\text{Var}[X] =$ _____

$\Pr[X = k] =$ _____

1 Warm-up

For each of the following parts, you may leave your answer as an expression.

- (a) You throw darts at a board until you hit the center area. Assume that the throws are i.i.d. and the probability of hitting the center area is $p = 0.17$. What is the probability that you hit the center on your eighth throw?

- (b) Let $X \sim \text{Geometric}(0.2)$. Calculate the expectation and variance of X .

- (c) Suppose the accidents occurring weekly on a particular stretch of a highway is Poisson distributed with average number of accidents equal to 3 cars per week. Calculate the probability that there is at least one accident this week.

- (d) Consider an experiment that consists of counting the number of α particles given off in a one-second interval by one gram of radioactive material. If we know from past experience that, on average, 3.2 such α -particles are given off per second, what is a good approximation to the probability that no more than 2 α -particles will appear in a second?

T/F: For non-independent RVs X_i ,

$$\text{Var}(X_1 + X_2 + \dots + X_n) = \text{Var}[X_1] + \dots + \text{Var}[X_n] = \sum_{i=1}^n \text{Var}[X_i]$$

Theorem 15.3. For independent random variables X, Y , we have

$$\text{Var}(X + Y) = \text{Var}(X) + \text{Var}(Y).$$

Proof. From the alternative formula for variance in Theorem 16.1 and linearity of expectation, we have

$$\begin{aligned} \text{Var}(X + Y) &= \mathbb{E}[(X + Y)^2] - (\mathbb{E}[X + Y])^2 \\ &= \mathbb{E}[X^2] + \mathbb{E}[Y^2] + 2\mathbb{E}[XY] - (\mathbb{E}[X] + \mathbb{E}[Y])^2 \\ &= (\mathbb{E}[X^2] - \mathbb{E}[X]^2) + (\mathbb{E}[Y^2] - \mathbb{E}[Y]^2) + 2(\mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]) \end{aligned}$$

$$= \text{Var}(X) + \text{Var}(Y) + 2(\mathbb{E}[XY] - \mathbb{E}[X]\mathbb{E}[Y]).$$

Since X, Y are independent, Theorem 16.2 implies that the final term in this expression is zero. \square

2 Coupon Collector Variance

It's that time of the year again - Safeway is offering its Monopoly Card promotion. Each time you visit Safeway, you are given one of n different Monopoly Cards with equal probability. You need to collect them all to redeem the grand prize.

Let X be the number of visits you have to make before you can redeem the grand prize. Show that $\text{Var}(X) = n^2 \left(\sum_{i=1}^n i^{-2} \right) - \mathbb{E}(X)$. [Hint: Try to break this problem down using indicators as with the coupon collector's problem. Are the indicators independent?]

What's wrong with the hint?

2 Coupon Collector Variance

It's that time of the year again - Safeway is offering its Monopoly Card promotion. Each time you visit Safeway, you are given one of n different Monopoly Cards with equal probability. You need to collect them all to redeem the grand prize.

Let X be the number of visits you have to make before you can redeem the grand prize. Show that $\text{Var}(X) = n^2 \left(\sum_{i=1}^n i^{-2} \right) - \mathbb{E}(X)$. [Hint: Try to express the number of visits as a sum of geometric random variables as with the coupon collector's problem. Are the variables independent?]

3 Boutique Store

Consider a boutique store in a busy shopping mall. Every hour, a large number of people visit the mall and each independently enters the boutique store with some small probability. The store

the hour, and each independently enters the boutique store with some small probability. The store owner decides to model X , the number of customers that enter her store during a particular hour, as a Poisson random variable with mean λ .

Suppose that whenever a customer enters the boutique store, they leave the shop without buying anything with probability p . Assume that customers act independently, i.e. you can assume that they each flip a biased coin to decide whether to buy anything at all. Let us denote the number of customers that buy something as Y and the number of them that do not buy anything as Z (so $X = Y + Z$).

- (a) What is the probability that $Y = k$ for a given k ? How about $\mathbb{P}[Z = k]$? *Hint:* You can use the identity

$$e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!}.$$

- (b) State the name and parameters of the distribution of Y and Z .

- (c) Prove that Y and Z are independent. In particular, prove that for every pair of values y, z , we have $\mathbb{P}[Y = y, Z = z] = \mathbb{P}[Y = y]\mathbb{P}[Z = z]$.
